

5. DYNAMICAL THEORY AND ITS APPLICATIONS

Fig. 5.1.3.5. Boundary conditions at the entrance surface for reflection geometry. (a) Reciprocal space; (b) direct space.

5.1.6.3); Λ_o in this case is called the *Pendellösung distance*, denoted Λ_L hereafter. Its geometrical interpretation, in the zero-absorption case, is the inverse of the diameter A_2A_1 of the dispersion surface in a direction defined by the cosines γ_h and γ_o with respect to the reflected and incident directions, respectively (Fig. 5.1.3.4). It reduces to the inverse of $A_{o2}A_{o1}$ (5.1.2.23) in the symmetric case.

In *reflection geometry*, it gives the absorption distance in the total-reflection domain and is called the *extinction distance*, denoted Λ_B (see Section 5.1.7.1). Its geometrical interpretation in the zero-absorption case is the inverse of the length $I_{o1}I_{h1} = I_{h2}I_{o2}$, Fig. 5.1.3.5.

In a *deformed crystal*, if distortions are of the order of the width of the rocking curve over a distance Λ_o , the crystal is considered to be slightly deformed, and ray theory (Penning & Polder, 1961; Kato, 1963, 1964a,b) can be used to describe the propagation of wavefields. If the distortions are larger, new wavefields may be generated by interbranch scattering (Authier & Balibar, 1970) and generalized dynamical diffraction theory such as that developed by Takagi (1962, 1969) should be used.

Using (5.1.3.8), expressions (5.1.3.5) and (5.1.3.6) can be rewritten in the very useful form:

$$\begin{aligned} \eta &= (\Delta\theta - \Delta\theta_o)\Lambda_o \sin 2\theta / (\lambda|\gamma_h|), \\ \delta &= \lambda|\gamma_h| / (\Lambda_o \sin 2\theta). \end{aligned} \quad (5.1.3.9)$$

The order of magnitude of the Darwin width 2δ ranges from a fraction of a second of an arc to ten or more seconds, and increases with increasing wavelength and increasing structure factor. For example, for the 220 reflection of silicon and Cu $K\alpha$ radiation, it is 5.2 seconds.

5.1.3.6. Solution of the dynamical theory

The coordinates of the tie points excited by the incident wave are obtained by looking for the intersection of the dispersion surface, (5.1.2.22), with the normal \mathbf{Mz} to the crystal surface (Figs. 5.1.3.4 and 5.1.3.5). The ratio ξ of the amplitudes of the waves of the

corresponding wavefields is related to these coordinates by (5.1.2.24) and is found to be

$$\begin{aligned} \xi_j &= D_{hj}/D_{oj} \\ &= -S(C)S(\gamma_h)[(F_h F_{\bar{h}})^{1/2}/F_{\bar{h}}] \\ &\quad \times \left\{ \eta \pm [\eta^2 + S(\gamma_h)]^{1/2} \right\} / (|\gamma|)^{1/2}, \end{aligned} \quad (5.1.3.10)$$

where the plus sign corresponds to a tie point on branch 1 ($j = 1$) and the minus sign to a tie point on branch 2 ($j = 2$), and $S(\gamma_h)$ is the sign of γ_h (+1 in transmission geometry, -1 in reflection geometry).

5.1.3.7. Geometrical interpretation of the solution in the zero-absorption case

5.1.3.7.1. Transmission geometry

In this case (Fig. 5.1.3.4) $S(\gamma_h)$ is +1 and (5.1.3.10) may be written

$$\xi_j = -S(C) \left[\eta \pm (\eta^2 + 1)^{1/2} \right] / \gamma^{1/2}. \quad (5.1.3.11)$$

Let A_1 and A_2 be the intersections of the normal to the crystal surface drawn from the Lorentz point L_o with the two branches of the dispersion surface (Fig. 5.1.3.4). From Sections 5.1.3.3 and 5.1.3.4, they are the tie points excited for $\eta = 0$ and correspond to the middle of the reflection domain. Let us further consider the tangents to the dispersion surface at A_1 and A_2 and let I_{o1} , I_{o2} and I_{h1} , I_{h2} be their intersections with T_o and T_h , respectively. It can be shown that $I_{o1}I_{h2}$ and $I_{o2}I_{h1}$ intersect the dispersion surface at the tie points excited for $\eta = -1$ and $\eta = +1$, respectively, and that the *Pendellösung distance* $\Lambda_L = 1/A_2A_1$, the width of the rocking curve $2\delta = I_{o1}I_{o2}/k$ and the deviation parameter $\eta = M_oM_h/A_2A_1$, where M_o and M_h are the intersections of the normal to the crystal surface drawn from the extremity of any incident wavevector \mathbf{OM} with T_o and T_h , respectively.
