

## 1. GENERAL RELATIONSHIPS AND TECHNIQUES

1.3.2.7.2. Duality between subdivision and decimation of period lattices

1.3.2.7.2.1. Geometric description of sublattices

Let  $\Lambda_{\mathbf{A}}$  be a period lattice in  $\mathbb{R}^n$  with matrix  $\mathbf{A}$ , and let  $\Lambda_{\mathbf{A}}^*$  be the lattice reciprocal to  $\Lambda_{\mathbf{A}}$ , with period matrix  $(\mathbf{A}^{-1})^T$ . Let  $\Lambda_{\mathbf{B}}, \mathbf{B}, \Lambda_{\mathbf{B}}^*$  be defined similarly, and let us suppose that  $\Lambda_{\mathbf{A}}$  is a sublattice of  $\Lambda_{\mathbf{B}}$ , i.e. that  $\Lambda_{\mathbf{B}} \supset \Lambda_{\mathbf{A}}$  as a set.

The relation between  $\Lambda_{\mathbf{A}}$  and  $\Lambda_{\mathbf{B}}$  may be described in two different fashions: (i) multiplicatively, and (ii) additively.

(i) We may write  $\mathbf{A} = \mathbf{B}\mathbf{N}$  for some nonsingular matrix  $\mathbf{N}$  with integer entries.  $\mathbf{N}$  may be viewed as the period matrix of the coarser lattice  $\Lambda_{\mathbf{A}}$  with respect to the period basis of the finer lattice  $\Lambda_{\mathbf{B}}$ . It will be more convenient to write  $\mathbf{A} = \mathbf{D}\mathbf{B}$ , where  $\mathbf{D} = \mathbf{B}\mathbf{N}\mathbf{B}^{-1}$  is a rational matrix (with integer determinant since  $\det \mathbf{D} = \det \mathbf{N}$ ) in terms of which the two lattices are related by

$$\Lambda_{\mathbf{A}} = \mathbf{D}\Lambda_{\mathbf{B}}.$$

(ii) Call two vectors in  $\Lambda_{\mathbf{B}}$  congruent modulo  $\Lambda_{\mathbf{A}}$  if their difference lies in  $\Lambda_{\mathbf{A}}$ . Denote the set of congruence classes (or 'cosets') by  $\Lambda_{\mathbf{B}}/\Lambda_{\mathbf{A}}$ , and the number of these classes by  $[\Lambda_{\mathbf{B}} : \Lambda_{\mathbf{A}}]$ . The 'coset decomposition'

$$\Lambda_{\mathbf{B}} = \bigcup_{\ell \in \Lambda_{\mathbf{B}}/\Lambda_{\mathbf{A}}} (\ell + \Lambda_{\mathbf{A}})$$

represents  $\Lambda_{\mathbf{B}}$  as the disjoint union of  $[\Lambda_{\mathbf{B}} : \Lambda_{\mathbf{A}}]$  translates of  $\Lambda_{\mathbf{A}}$ .  $\Lambda_{\mathbf{B}}/\Lambda_{\mathbf{A}}$  is a finite lattice with  $[\Lambda_{\mathbf{B}} : \Lambda_{\mathbf{A}}]$  elements, called the residual lattice of  $\Lambda_{\mathbf{B}}$  modulo  $\Lambda_{\mathbf{A}}$ .

The two descriptions are connected by the relation  $[\Lambda_{\mathbf{B}} : \Lambda_{\mathbf{A}}] = \det \mathbf{D} = \det \mathbf{N}$ , which follows from a volume calculation. We may also combine (i) and (ii) into

$$(iii) \quad \Lambda_{\mathbf{B}} = \bigcup_{\ell \in \Lambda_{\mathbf{B}}/\Lambda_{\mathbf{A}}} (\ell + \mathbf{D}\Lambda_{\mathbf{B}})$$

which may be viewed as the  $n$ -dimensional equivalent of the Euclidean algorithm for integer division:  $\ell$  is the 'remainder' of the division by  $\Lambda_{\mathbf{A}}$  of a vector in  $\Lambda_{\mathbf{B}}$ , the quotient being the matrix  $\mathbf{D}$ .

1.3.2.7.2.2. Sublattice relations for reciprocal lattices

Let us now consider the two reciprocal lattices  $\Lambda_{\mathbf{A}}^*$  and  $\Lambda_{\mathbf{B}}^*$ . Their period matrices  $(\mathbf{A}^{-1})^T$  and  $(\mathbf{B}^{-1})^T$  are related by:  $(\mathbf{B}^{-1})^T = (\mathbf{A}^{-1})^T \mathbf{N}^T$ , where  $\mathbf{N}^T$  is an integer matrix; or equivalently by  $(\mathbf{B}^{-1})^T = \mathbf{D}^T (\mathbf{A}^{-1})^T$ . This shows that the roles are reversed in that  $\Lambda_{\mathbf{B}}^*$  is a sublattice of  $\Lambda_{\mathbf{A}}^*$ , which we may write:

$$(i)^* \quad \Lambda_{\mathbf{B}}^* = \mathbf{D}^T \Lambda_{\mathbf{A}}^*$$

$$(ii)^* \quad \Lambda_{\mathbf{A}}^* = \bigcup_{\ell^* \in \Lambda_{\mathbf{A}}^*/\Lambda_{\mathbf{B}}^*} (\ell^* + \Lambda_{\mathbf{B}}^*).$$

The residual lattice  $\Lambda_{\mathbf{A}}^*/\Lambda_{\mathbf{B}}^*$  is finite, with  $[\Lambda_{\mathbf{A}}^* : \Lambda_{\mathbf{B}}^*] = \det \mathbf{D} = \det \mathbf{N} = [\Lambda_{\mathbf{B}} : \Lambda_{\mathbf{A}}]$ , and we may again combine (i)\* and (ii)\* into

$$(iii)^* \quad \Lambda_{\mathbf{A}}^* = \bigcup_{\ell^* \in \Lambda_{\mathbf{A}}^*/\Lambda_{\mathbf{B}}^*} (\ell^* + \mathbf{D}^T \Lambda_{\mathbf{A}}^*).$$

1.3.2.7.2.3. Relation between lattice distributions

The above relations between lattices may be rewritten in terms of the corresponding lattice distributions as follows:

$$(i) \quad R_{\mathbf{A}} = \frac{1}{|\det \mathbf{D}|} \mathbf{D}^{\#} R_{\mathbf{B}}^*$$

$$(ii) \quad R_{\mathbf{B}} = T_{\mathbf{B}/\mathbf{A}} * R_{\mathbf{A}}$$

$$(i)^* \quad R_{\mathbf{B}}^* = \frac{1}{|\det \mathbf{D}|} (\mathbf{D}^T)^{\#} R_{\mathbf{A}}^*$$

$$(ii)^* \quad R_{\mathbf{A}}^* = T_{\mathbf{A}/\mathbf{B}}^* * R_{\mathbf{B}}^*$$

where

$$T_{\mathbf{B}/\mathbf{A}} = \sum_{\ell \in \Lambda_{\mathbf{B}}/\Lambda_{\mathbf{A}}} \delta_{(\ell)}$$

and

$$T_{\mathbf{A}/\mathbf{B}}^* = \sum_{\ell^* \in \Lambda_{\mathbf{A}}^*/\Lambda_{\mathbf{B}}^*} \delta_{(\ell^*)}$$

are (finite) residual-lattice distributions. We may incorporate the factor  $1/|\det \mathbf{D}|$  in (i) and (i)\* into these distributions and define

$$S_{\mathbf{B}/\mathbf{A}} = \frac{1}{|\det \mathbf{D}|} T_{\mathbf{B}/\mathbf{A}}, \quad S_{\mathbf{A}/\mathbf{B}}^* = \frac{1}{|\det \mathbf{D}|} T_{\mathbf{A}/\mathbf{B}}^*.$$

Since  $|\det \mathbf{D}| = [\Lambda_{\mathbf{B}} : \Lambda_{\mathbf{A}}] = [\Lambda_{\mathbf{A}}^* : \Lambda_{\mathbf{B}}^*]$ , convolution with  $S_{\mathbf{B}/\mathbf{A}}$  and  $S_{\mathbf{A}/\mathbf{B}}^*$  has the effect of averaging the translates of a distribution under the elements (or 'cosets') of the residual lattices  $\Lambda_{\mathbf{B}}/\Lambda_{\mathbf{A}}$  and  $\Lambda_{\mathbf{A}}^*/\Lambda_{\mathbf{B}}^*$ , respectively. This process will be called 'coset averaging'. Eliminating  $R_{\mathbf{A}}$  and  $R_{\mathbf{B}}$  between (i) and (ii), and  $R_{\mathbf{A}}^*$  and  $R_{\mathbf{B}}^*$  between (i)\* and (ii)\*, we may write:

$$(i') \quad R_{\mathbf{A}} = \mathbf{D}^{\#} (S_{\mathbf{B}/\mathbf{A}} * R_{\mathbf{A}})$$

$$(ii') \quad R_{\mathbf{B}} = S_{\mathbf{B}/\mathbf{A}} * (\mathbf{D}^{\#} R_{\mathbf{B}})$$

$$(i')^* \quad R_{\mathbf{B}}^* = (\mathbf{D}^T)^{\#} (S_{\mathbf{A}/\mathbf{B}}^* * R_{\mathbf{B}}^*)$$

$$(ii')^* \quad R_{\mathbf{A}}^* = S_{\mathbf{A}/\mathbf{B}}^* * [(\mathbf{D}^T)^{\#} R_{\mathbf{A}}^*].$$

These identities show that period subdivision by convolution with  $S_{\mathbf{B}/\mathbf{A}}$  (respectively  $S_{\mathbf{A}/\mathbf{B}}^*$ ) on the one hand, and period decimation by 'dilation' by  $\mathbf{D}^{\#}$  on the other hand, are mutually inverse operations on  $R_{\mathbf{A}}$  and  $R_{\mathbf{B}}$  (respectively  $R_{\mathbf{A}}^*$  and  $R_{\mathbf{B}}^*$ ).

1.3.2.7.2.4. Relation between Fourier transforms

Finally, let us consider the relations between the Fourier transforms of these lattice distributions. Recalling the basic relation of Section 1.3.2.6.5,

$$\mathcal{F}[R_{\mathbf{A}}] = \frac{1}{|\det \mathbf{A}|} R_{\mathbf{A}}^*$$

$$= \frac{1}{|\det \mathbf{D}\mathbf{B}|} T_{\mathbf{A}/\mathbf{B}}^* * R_{\mathbf{B}}^* \quad \text{by (ii)^*}$$

$$= \left( \frac{1}{|\det \mathbf{D}|} T_{\mathbf{A}/\mathbf{B}}^* \right) * \left( \frac{1}{|\det \mathbf{B}|} R_{\mathbf{B}}^* \right)$$
