

3.1. GENERAL CONSIDERATIONS WHEN DEFINING A CIF DATA ITEM

Example 3.1.5.1. A DDL1 dictionary identification block.

```

data_on_this_dictionary
  _dictionary_name          cif_core.dic
  _dictionary_version       2.3.1
  _dictionary_update        2005-06-27
  _dictionary_history
; 1991-05-27 Created from CIF Dictionary text. SRH
 1991-05-30 Validated with CYCLOPS & CIF ms. SRH
  ...
;

```

be seen that there is no sure way of working out the category from the complete data name except by referring to its `_category` attribute in the associated dictionary. This differs from the DDL2 convention of including an explicit separator (a full stop) between the category name and the remainder of a data name.

While it is not mandatory that a data name should incorporate its category name as a leading component, authors are strongly encouraged to adopt this convention. A small number of core data items that did not conform to this convention have been deprecated in later releases of the core dictionary. However, in the powder dictionary the convention has been broken so that one can present data sets separately or merge them together. In this dictionary, some data names beginning with the strings `_pd_calc`, `_pd_meas` and `_pd_proc` all belong formally to the category PD_DATA. This allows calculated data values to be tabulated with raw and processed measurements if this is useful.

One other case where a data name does not begin with its associated category name is that of the pseudo data names such as `_exptl_[]` that appear in the dictionary to describe the purpose of a category (Section 3.1.5.3). Such data names are always assigned the category CATEGORY_OVERVIEW and are further differentiated from other data names by having a data type of 'null'.

3.1.5.1. The dictionary identification block

As mentioned above, the dictionary file must contain information that unambiguously states its identity and version. In DDL1-based CIF dictionaries, this is achieved by itemizing the full set of dictionary attributes (see Section 2.5.6.5) within a data block named `data_on_this_dictionary`, as in Example 3.1.5.1 from the core dictionary.

3.1.5.2. Irreducible sets of data items

In general, a dictionary data block defines a single data item. However, there are instances where several related data names are defined in the same data block. Sometimes this has been done for convenience, to produce a compact listing of similar data names that have common attributes and whose small differences in meaning can best be expressed by a single definition. Such groupings are discouraged, except where they represent components of a larger entity that has no sensible meaning in the absence of any of the components. For example, the data block `data_refl_index_` defines the three data items `_refln_index_h`, `_refln_index_k` and `_refln_index_l` that represent the Miller indices of a reflection. All three indices must have a value in order to specify a reflection and so each has no meaning in isolation.

Note that there is no formal method of expressing this close relationship within DDL1 except by grouping the definitions in the same data block in this way. In DDL2 dictionaries, it is common to assign the components of an irreducible set to a specific subcategory.

Example 3.1.5.2. A category description in a DDL1 dictionary.

```

data_exptl_[]
  _name                    '_exptl_[]'
  _category                category_overview
  _type                    null
  loop_example
  _example_detail
# -----
;  _exptl_absorpt_coefficient_mu    0.962
;  _exptl_absorpt_correction_type   psi-scan
;  _exptl_absorpt_process_details
;  'North, Phillips & Mathews (1968)'
;  _exptl_absorpt_correction_T_min  0.929
;  _exptl_absorpt_correction_T_max  0.997
;
;  Example 1 - based on a paper by Steiner [Acta
;  Cryst. (1996), C52, 2554-2556].
;
# -----
;  _definition
;  Data items in the EXPTL category record
;  details about the experimental work prior
;  to the intensity measurements and details
;  about the absorption-correction technique
;  employed.
;

```

3.1.5.3. Category descriptions

As discussed above, categories in DDL1 are intended as 'natural groupings' of data items. To document the purpose of a category within a dictionary, 'pseudo' data names are used. All pseudo data names are assigned a `_category` attribute of `category_overview` and have an associated `_type` value of 'null'. They are also named by convention as `_category_name_[dictionarycode]`, for example `_pd_data_[pd]` for the description of the PD_DATA category in the powder dictionary (indicated by the code 'pd' in square brackets). For the core dictionary, `dictionarycode` is not given, resulting in names like `_exptl_[]` to describe the EXPTL category.

Example 3.1.5.2 is a slightly edited extract from the core dictionary showing how a data block for a category description is composed, including the presence of an example.

Note that the `dictionarycode` extension allows a dictionary to include comments on items that it defines in a category already established in the core dictionary. For example, the modulated structures dictionary includes the category overview item `_audit_link_[ms]`. This describes the convention adopted to express the relationship between data blocks in a modulated structures data file using the `_audit_link_` data names already defined in the core dictionary.

3.1.5.4. Data-item definitions

The data blocks described in Sections 3.1.5.1 and 3.1.5.3 are used to identify the dictionary and to describe the nature and purpose of a category. The remaining data blocks in a dictionary provide the attributes of data values in a form suitable for machine extraction and validation. The following examples show how this is done for various types of data.

3.1.5.4.1. Definitions of single quantities

Example 3.1.5.3 is the core dictionary definition of the data name for the ambient temperature during the experiment. Because this is a single (non-looped) value, the relevant data name is one among several discrete items in the DIFFRN category. No further description of its relationship to other data items is required.

The type of the associated data value (*numb* for numerical) is specified, together with any constraint on its legal value. The range

3. CIF DATA DEFINITION AND CLASSIFICATION

Example 3.1.5.3. A simple definition of a data item describing a physical quantity.

```
data_diffrn_ambient_temperature
  _name          'diffrn_ambient_temperature'
  _category      diffrn
  _type          numb
  _type_conditions esd
  _enumeration_range 0.0:
  _units         K
  _units_detail  kelvin
  _definition
;   The mean temperature in kelvins at which the
   intensities were measured.
;
```

specified (0.0:) indicates that it may be any non-negative real number. The physical units of the quantity are also indicated.

The `_definition` attribute is a concise human-readable documentation of the meaning associated with the data name.

Example 3.1.5.4 is taken from the powder dictionary and illustrates a data item that can have only one of a limited set of values. This data item indicates the geometry of the experiment. The associated data value is of type *char* and may legally take only one of the two possible values listed.

3.1.5.4.2. Looped data

Many of the attributes of looped data items, such as their physical units or valid numerical values, may be defined in exactly the same way as for non-looped data. However, more care needs to be taken to describe the relationships between different looped data items.

Consider the following example listing of some three-dimensional atom-site coordinates and displacement parameters.

```
loop_
  _atom_site_label
  _atom_site_fract_x
  _atom_site_fract_y
  _atom_site_fract_z
  _atom_site_U_iso_or_equiv
  _atom_site_thermal_displace_type
O1 .4154(4) .56990(10) .3026000 .0600(10) Uani
C2 .5630(5) .5087(2) .32460(10) .060(2) Uani
C3 .5350(5) .4920(2) .39970(10) .0480(10) Uani
N4 .3570(3) .55580(10) .4167000 .0390(10) Uani
C5 .3000(5) .6122(2) .35810(10) .0450(10) Uani
```

```
loop_
  _atom_site_aniso_label
  _atom_site_aniso_U_11
  _atom_site_aniso_U_22
  _atom_site_aniso_U_33
  _atom_site_aniso_U_12
  _atom_site_aniso_U_13
  _atom_site_aniso_U_23
O1 .071(1) .076(1) .0342(9) .008(1) .0051(9) -.0030(9)
C2 .060(2) .072(2) .047(1) .002(2) .013(1) -.009(1)
C3 .038(1) .060(2) .044(1) .007(1) .001(1) -.005(1)
N4 .037(1) .048(1) .0325(9) .0025(9) .0011(9) -.0011(9)
C5 .043(1) .060(1) .032(1) .001(1) -.001(1) .001(1)
```

```
loop_
  _geom_bond_atom_site_label_1
  _geom_bond_atom_site_label_2
  _geom_bond_distance
O1 C2 1.342(4)
O1 C5 1.439(3)
C2 C3 1.512(4)
C2 O21 1.199(4)
```

These loops, or tables of values, are properties of atom sites, each identified by a label such as O1. The definition of a data name such as `_atom_site_U_iso_or_equiv` expresses this by using the `DDL1_list_reference` attribute (Example 3.1.5.5).

Example 3.1.5.4. A data item that can take only one of a discrete set of allowed values.

```
data_pd_spec_mount_mode
  _name          'pd_spec_mount_mode'
  _category      pd_spec
  _type          char
  _loop_enumeration reflection
                  transmission
  _definition
;   A code describing the beam path through
   the specimen.
;
```

Example 3.1.5.5. Definition relating a looped data item to the item used to identify a 'loop packet', or row of entries in a table.

```
data_atom_site_U_iso_or_equiv
  _name          'atom_site_U_iso_or_equiv'
  _category      atom_site
  _type          numb
  _type_conditions esd
  _list          yes
  _list_reference 'atom_site_label'
```

Example 3.1.5.6. Definition of a mandatory item within a loop.

```
data_atom_site_label
  _name          'atom_site_label'
  _category      atom_site
  _type          char
  _list          yes
  _list_mandatory yes
  loop_list_link_child
    'atom_site_aniso_label'
    'geom_bond_atom_site_label_1'
    'geom_bond_atom_site_label_2'
```

For an entry in the table to make sense, the site identifier must be present, so the definition for `_atom_site_label` declares it a mandatory item within its list (Example 3.1.5.6).

It is common for an atom-site identifier to be used in several related tabulations in a particular crystal structure description, and in a CIF description this means that it may occur in several different looped lists. The dictionary definition gives a formal account of this by listing the data names in other looped lists which are just different manifestations of this same item. This is done using the `_list_link_child` attribute, which identifies the data names to which the one being currently defined is 'parent'. In Example 3.1.5.6 (which is a subset of the full list in the core dictionary), `_atom_site_aniso_label`, `_geom_bond_atom_site_label_1` and `_geom_bond_atom_site_label_2` are identified as children of `_atom_site_label`.

It can be seen immediately that `_atom_site_aniso_label` is the atom-site identification label appearing in the second table in the example listing above, and the `_geom_bond` items are clearly atom-site labels in a table of bonding properties between specified sites. There is, however, a difference between the two secondary tables: the bond-properties table is described by data items in the `GEOM_BOND` category, but the table of anisotropic displacement parameters includes data names that have the same `_category` attribute as the coordinate data items, namely `ATOM_SITE`. The latter is an example of multiple lists or tables belonging to the same category, a feature permitted only in DDL1-based data files.

3.1.5.4.3. Units

The physical units in which a quantitative data item must be expressed are identified by the DDL1 attributes `_units` and

3.1. GENERAL CONSIDERATIONS WHEN DEFINING A CIF DATA ITEM

`_units_detail`. The latter is a character field describing the units; the `_units` attribute is a code that may be interpreted by machine. In DDL1-based dictionaries, type codes are purely conventional, and there is no mechanism for converting units or relating quantities in different units. Table 3.1.5.1 lists the units codes used in the DDL1-based dictionaries described in this volume. There can be some inconsistencies: two codes ('s' and 'sec') are already in use to indicate the time unit of seconds.

The original CIF paper (Hall *et al.*, 1991) described a convention allowing physical quantities to be listed in a CIF in units other than those specified in the dictionary. Under this convention, a data name representing a value expressed in different units could be constructed by appending one of a series of known 'units extension codes' to the standard data name. Thus `_cell_length_a_pm` would represent a cell length expressed in picometres instead of the default ångströms. This approach is now deprecated, and all quantities must be expressed in the single unit permitted in their definition block. However, to allow the formal validation of old CIFs, a 'compatibility dictionary' is available which defines all data names that could have been constructed under this convention in a properly DDL1.4-compliant form. *This dictionary should only be used for validating old CIFs, and must not be used to construct new data files.* The dictionary is called `cif.compat.dic` in the IUCr CIF dictionary register (see Section 3.1.8.2).

3.1.6. Constructing a DDL2 dictionary

The DDL2 dictionary definition language was designed to specify a relational data model and has provision for including within a dictionary tables of relationships between data entries. Like a relational database which contains tables describing the data tables in the database, DDL2-based dictionaries contain definition blocks describing CIF categories, units and relationships as well as data items.

Unlike DDL1 dictionaries, a DDL2 dictionary is presented as a single data block. Within this data block a number of looped lists describe properties of the dictionary as a whole, or properties and relationships shared across the items defined in the dictionary. Typically these are: the dictionary name, version identifiers and revision history; the category groupings that give structure to the items defined by the dictionary; the labels that identify closely related data items; and the physical units employed in the dictionary, their definitions in terms of base units and their interconversion factors.

Definitions of individual data items and categories are contained within save frames. While the save frames are not referenced by name in any dictionary application, they permit multiple occurrences of data definition tags within the scope of a single data block and are therefore suitable for structuring a data dictionary. It is a convention that the name of a save frame defining a category is given in capitals, and the name of a save frame for a definition of a data item is given as lower-case. For example, `save_ATOM_SITE` is the name of the save frame defining the category with the `atom_site` identifier, while `save_atom_site.details` is the name of the save frame holding the definition of the individual data name `_atom_site.details` (note how the initial underscore character of the data name is preserved following the initial `save_` string of the save-frame name).

As with DDL1 dictionaries, the name of the dictionary itself (given by the data name `_dictionary.title`) is usually of the form `cif_identifier.dic`, where the *identifier* is a short code for the topic area of the dictionary (e.g. 'img' for the image dictionary, 'sym' for the symmetry dictionary).

Table 3.1.5.1. *Units codes and their interpretation in DDL1-based dictionaries*

Unit code (<code>_units</code>)	Meaning (<code>_units_detail</code>)
A	Ångströms
A ⁻¹	Reciprocal ångströms
A ²	Ångströms squared
A ³	Ångströms cubed
Da	Daltons
K	Kelvins
Kmin ⁻¹	Kelvins/minute
Mgm ⁻³	Megagrams per cubic metre
\ms	Microseconds
deg	Degrees
deg/min	Degrees per minute
eV	Electronvolts
e ⁻ A ⁻³	Electrons per cubic ångström
fm	Femtometres
kPa	Kilopascals
kV	Kilovolts
kW	Kilowatts
mA	Milliamperes
min	Minutes
mm	Millimetres
mm ⁻¹	Reciprocal millimetres
s	Seconds
sec	Seconds

As is invariable with DDL2 data names, the names themselves are formed from the category name separated by a full stop from the specific descriptor of the item.

Fig. 3.1.6.1 shows the structure of the macromolecular CIF dictionary. The ordering of the various looped lists and save frames is of no significance for machine parsing. The sole data block has the same name as the dictionary title string and the data block is introduced by the dictionary identification data items. The dictionary revision history introduces the file, followed by information about the extended data types and physical units used within the current dictionary. These are followed by the lists of closely related items (corresponding to 'irreducible sets' in DDL1 dictionaries and called 'subcategories' in the terminology of DDL2) and lists of category groupings. The body of the dictionary contains category and item definitions. Each category definition is followed by the definitions of its component data items. The ordering is alphabetic by category and then alphabetic by item name within categories.

3.1.6.1. Dictionary identification

Dictionary files must contain information that unambiguously states their identity and version. In DDL2-based dictionaries this is done using the dictionary attributes described in Section 2.6.6.4. The name of the data block comprising the whole content of a DDL2 dictionary is by convention the same as the dictionary identification string given as `_dictionary.title`. This value is repeated as the value of `_dictionary.datablock_id` (see Example 3.1.6.1) for use in checking the consistency of the dictionary.

The dictionary history is also an important audit record of changes to the dictionary content. Unlike in DDL1-based dictionaries where the history is contained in a single field, DDL2 provides a looped list of version labels, dates and annotations. For convenience, the history records in large DDL2-based dictionaries are sometimes placed at the end of the dictionary file.

3.1.6.2. Subcategory definitions

In the DDL1 formalism, particular relationships between data items may sometimes be stated within a text description or may be implied by the organization of the dictionary (where several data
